Abstract

The main objective of “Cloud based IT Infra with Central Identity” Phase II is provide the implementation to our objectives.

Implementing the Web based central identity, network based central identity, achieve the combination and deploy all these in the private cloud

Chapter 1

Introduction

1.1 Introduction

“Cloud Based IT Infra with Central Identity” is a complete solution, based on private cloud to enhance and efficient utilization the IT Infrastructure of an emerging Universities and Organizations with Central Identity for all its users to access its services.

It is going to be developed in 3 phases

- *Private cloud*
- *Deploying Network Services*
- *Central Identity*

1.1.1 Private Cloud

Private Cloud establishment is targeted for hardware resource pooling, providing high computational and scalable virtual machines for deploying network based applications (smtp, proxy, ftp), web application and Network storage.

1.1.2 Deploying Network Services

Configuration of Uniform hardware experience over the complete university includes single sign on on every device, configuration of mail servers etc.

1.1.3 Central Identity

Essential part that combines normal network services(proxy, mail, etc.) and organizational web & native applications. In addition to that this central identity is available to thrid party developers as API with dynamic based role user authentication protocols.

Chapter 2

Phase I Work

As part of Phase I, we have done literature survey and analyzed feasibility of the several components

2.1 Components

- Central Identity
 - Single Sign-On with REST API
 - Identity Management
 - Dynamic Role Based Access Control
- Network Based Central Identity
 - LDAP Servers
 - NFS Servers
- Cloud Computing
 - Cloud Characteristics
 - Service Models
 - Deployment Models
- Private Clouds
 - Introduction
 - Open Source Tools

Chapter 3

Phase II Work

As part of Phase II, we have tried to implement some of the above mention components

3.1 Components

- Web based Signle Sign On
 - OAuth Provider
 - University Users Profiles
 - REST API
 - Support of assign roles to users with their permission set
 - Testing oauth client library in PHP using php-curl
- Network Components
 - LDAP Server
 - NFS Server
 - Haproxy
 - GlusterFS
 - XtreamFS
- Private Infrastructure Cloud
 - Openstack Architecture
 - Installation
 - Virtual Machines

Chapter 4

Private Infrastructure Cloud

To support this central identity both the network and web network central identity we want to go for the private cloud deployment it includes creating the Private Infrastructure Cloud with openstack and creating Virtual Machines for installing these services and assign them the IP address.

4.1 Openstack Architecture

Chapter 5

Conclusion & Future Work
